Education

Florida International University, Miami, FL

Dec. 2025

Bachelor of Science in Computer Engineering

Relevant Coursework: Machine Learning, Data Structures and Algorithms, Systems Programming, Embedded Operating Systems, Computer Architecture, Analytics and Cloud Computing, Statistics and Probability, Linear Algebra

Technical Skills

Languages: Python, Java, C++, TypeScript, JavaScript, SQL, HTML/CSS

Frameworks & Tools: React, Next.js, Tailwind CSS, Node.js, Express.js, Flask, FastAPI, Electron, Firebase, Git, GitHub, WordPress

ML & Data: scikit-learn, PyTorch, TensorFlow, Pandas, NumPy, Feature Engineering, Model Evaluation, Time-Series Validation

Systems & Platforms: Linux, Docker, AWS ECS, REST APIs, MongoDB, Embedded Systems, Distributed Systems

Experience

Full Stack Engineer (Contract), JyJ Med Spa

Mar. – May 2022

- Built and launched the company website, jyjmedandspas.com, using WordPress to improve online presence and support customer-facing features such as service information and booking.
- Developed a cross-platform Electron desktop application with a Python Flask backend for inventory tracking and internal operations.
- Implemented Firebase authentication and access control in the inventory application to protect sensitive updates and improve data security.
- Packaged and deployed the desktop application for day-to-day business use, supporting adoption across internal workflows.

Software Engineer, AI Evaluation (Contract), Mercor

Jan. – Apr. 2023

- Evaluated and debugged 200+ AI-generated coding solutions across algorithms, data structures, operating systems, and databases.
- Identified recurring logic and edge-case failures and translated findings into structured feedback for model evaluation.
- Built reference implementations to compare generated solutions for correctness, efficiency, and reliability.

Projects

Sports Card | Expected value screener + Autonomous ML trading bot | Personal Project

2026 – Present

- Built a sports analytics platform that analyzes market odds and surfaces expected value, Kelly sizing, and arbitrage opportunities.
- Developed the frontend in React and TypeScript and connected it to backend services for odds processing, game analysis, and user-facing workflows.
- Currently designing an AI-driven trading bot that connects to Kalshi via WebSocket for live market data, combining automated positive EV detection, an arbitrage layer, and machine learning to identify pricing inefficiencies in prediction markets and surface profitable spread opportunities.

Portfolio Website + Embedded Assistant | Personal Project

Mar. 2026

- Built a personal portfolio website to showcase projects, technical skills, and engineering experience through a polished, interactive frontend.
- Added an embedded assistant that answers questions about my background and work using a structured project knowledge base and backend chat pipeline.

ShelfOS | Inventory + Treatment Tracker | Personal Project

Jan. – Feb. 2024

- Built a desktop application for inventory and treatment tracking using Electron and a Flask backend.
- Added local data storage, authentication, and workflow support for managing products, services, and daily operations.
- Designed the system around real business needs such as operational tracking, reporting, and inventory visibility.

Power Distribution Module | Senior Design

Aug. – Dec. 2025

- Built a real-time monitoring platform for an 8-channel Power Distribution Module using React, Electron, Python, and Flask.
- Implemented a telemetry pipeline for streaming voltage, current, and temperature data from the hardware system.
- Added channel-level monitoring and control features to help validate system behavior and support reliability testing.
